# 线下SDK中修改小车飞机数量和订单位置的 办法

修改之前请做好各配置文件的备份

peerld, tcpPort, udpPort字段不能重复, 全局唯一

### SDK中各docker配置文件的位置

docker	docker中配置文件地址
scene	/evaluator/config/scene.config
drone	/config/drone.json
car	/car_log/config.json
user	/config/config.json

#### 修改小车数量

需要修改 car, user, scene中的配置文件

打开配置文件,找到magvParamList字段,这个数组存储的是小车的数据

修改birthplace出生位置,小车不碰撞,在商家机场内即可

修改magvSn小车sn,不重复即可

修改peerId镜像的标识,不能重复,位数不要变,自增即可

修改tcpPort, 不重复自增即可

修改udpPort,不重复自增即可

修改完之后,确保3份配置文件中magvParamList字段数据完全一致,重新启动镜像即可

```
"magvParamList": [
   {
        "birthplace": {
           "x": 184,
           "y": 434,
           "z": -16
       },
        "currentDir": "/opt/meituan/bvlos/race/magv",
       "guid": "GUID_14_600_1",
       "ip": "192.168.100.2",
       "lastReportTime": 1723444030039,
        "magvSn": "SIM-MAGV-0001",
       "mapServerIp": "192.168.100.5",
       "mapServerPort": 5050,
       "peerId": 49832750,
        "sceneIp": "192.168.100.5",
        "scenePeerId": 49497179,
        "scenePort": 9999,
        "status": "PEER NO CONNECTION",
        "taskId": 600,
        "tcpPort": 3000,
       "udpPort": 3001
   },
    {
        "birthplace": {
           "x": 196,
           "y": 434,
           "z": -16
       },
        "currentDir": "/opt/meituan/bvlos/race/magv",
        "guid": "GUID_14_600_1",
       "ip": "192.168.100.2",
        "lastReportTime": 1723444030041,
       "magvSn": "SIM-MAGV-0002",
```

## 修改飞机数量

需要修改 drone, user, scene中的配置文件

打开配置文件,找到droneParamList字段,这个数组存储的是无人机的数据

修改droneSn无人机sn,不重复即可

修改peerId镜像的标识,不能重复,位数不要变,自增即可

修改tcpPort,不重复自增即可

修改udpPort,不重复自增即可

修改完之后,确保3份配置文件中droneParamList字段数据完全一致,重新启动镜像即可

```
"droneParamList": [
   {
        "birthplace": {
           "x": 185,
           "y": 425,
           "z": -16
       },
        "controlType": "SIMPLE FLIGHT",
        "currentDir": "/opt/meituan/bvlos/race/drone",
       "droneSn": "SIM-DRONE-0001",
        "guid": "GUID_14_600_1",
        "ip": "192.168.100.3",
        "lastReportTime": 1723444030034,
        "mapServerIp": "192.168.100.5",
        "mapServerPort": 5050,
        "peerId": 49419368,
        "sceneIp": "192.168.100.5",
        "scenePeerId": 49497179,
        "scenePort": 9999,
        "status": "PEER NO CONNECTION",
        "taskId": 600,
        "tcpPort": 7000,
        "udpPort": 7001
   },
   {
       "birthplace": {
           "x": 185,
            "y": 425,
```

# 修改卸货点和订单位置

需要修改 scene, user 中的配置文件

• 修改卸货点

打开配置文件,找到unloadingCargoStationList字段,这个数组存储的是卸货点数据 修改index,正整数,自增加可

修改name, 不重复即可

修改position,不重复且在地图内,自行选择

修改后确保2份配置文件中unloadingCargoStationList字段内容完全一致

```
"unloadingCargoStationList": [
        "index": 1,
        "name": "测试卸货点1",
        "position": {
            "x": 530,
            "y": 388,
            "z": -20
    },
    {
        "index": 2,
        "name": "测试卸货点2",
        "position": {
            "x": 590,
            "y": 392,
            "z": -16
        }
   }
],
```

#### • 修改订单位置

打开配置文件,找到waybillParamList字段,这个数组存储的是订单数据修改index字段,正整数,自增即可,两个index确保一致修改name,不重复即可

修改targetPosition,字段值为unloadingCargoStationList数组中任意元素position的值 修改后确保2份配置文件中waybillParamList字段内容完全一致,重新启动镜像即可

```
"waybillParamList": [
   {
       "betterTime": 1500,
       "cargoParam": {
           "birthplace": {
              "x": 190,
              "y": 425,
               "z": -16
          "index": 1,
           "name": "测试货物1",
           "weight": 2.671
       "index": 1,
       "loadingStationInfo": {
          "$ref": "$.taskParam.waybillParamList[0].cargoParam.birthplace"
       },
       "orderTime": 300,
       "targetPosition": {
           "x": 590,
           "y": 392,
          "z": -16
       "timeout": 1800
   },
   {
       "betterTime": 1500,
       "cargoParam": {
       "birthplace": {
```
